

TOPIC: Towards Clinically Meaningful Explainability in ICU Time Series Prediction Models

THEME 1, TOPIC 2

Research Gap and Question:

Current explainability methods such as SHAP and LIME are not inherently designed for time series data and fail to capture temporal dependencies, resulting in explanations that lack temporal coherence and are not clinically interpretable in ICU decision-making contexts.

How can explainability methods be adapted or enhanced to capture temporal dependencies and provide clinically meaningful interpretations for ICU time series prediction models?
